Subject: Some Innovative suggestion to save water

Dear Sir,

Here submitting some ideas by which we can save water in huge quantity.

- 1) Grey water recycling system should be installed in each and every House, commercial complex, industry, schools, college, etc. It will save App. 50% water every day.
- 2) Rain Water Harvesting must be mandatory in every House, commercial complex, industry, schools, college, etc.
- 3) In support of drip irrigation some new innovative technique may be added by which only half liter water will require for a plant.
- 4) Water given to plants (road side and in between divider) by pipe, due to this too much water wastage is counted. Instead of this drip irrigation thin pipe may be embedded in the soil along with roots of the plants. Due to this evaporation rate of water will come down nearby zero and water consumption will reduce app. 80%.
- 5) In support of my ideas here enclosing PPPT presentation for your kind perusal.

You are requested to give me some time to explain in detail with laptop presentation.

I confident due to my idea we can save lot of water.

Thanks
